

Data Sheet for Maize Image Data Collected in Uganda Under the Lacuna Project

We present the Lacuna Maize data sheet created by Makerere Artificial Intelligence Lab created by a group of researchers from the Makerere Artificial Intelligence Lab in Makerere University in Uganda. We follow the datasheet for dataset framework created by (Gebru et al. 2021).

Motivation	
For what purpose was the data set created?	The dataset was created to provide an open, well-labelled, sufficiently curated and accessible <i>maize image dataset</i> . Data scientists, researchers, and the broader machine learning community can use the dataset for various machine learning experiments to build maize crop disease diagnosis and spatial analysis solutions.
Was there a specific task in mind?	Although the agricultural sector is a national economic development priority in sub-Saharan Africa, crop pests and diseases have been the challenge affecting major food security crops like Maize. During the last decade, Maize Leaf Blight disease, also known as Northern Corn Leaf Blight, has become a menace in low land agro-ecological zones (Badru et al. 2021). On the other hand, Maize Streak Disease caused by the Maize Streak Virus is regarded as the third most serious disease affecting maize in sub-Saharan Africa (Martin and Shepherd 2009). The prominence of these diseases has dramatically affected Maize yields. The current state of data collection and crop pest and disease diagnosis is transitioning from disease identification using visible symptoms to using data-driven solutions applying machine learning and computer vision techniques. The image data previously collected has not been sufficiently curated, prepared, and shared with the broader community.
Who created the dataset?	The dataset was created by scientists from the Makerere Artificial Intelligence Lab and the National Crops Resources Research Institute (NaCRRI) in Namulonge, Uganda. NaCRRI is an institute of the National Agricultural Research Organisation (NARO) in charge of crop research.

Who funded the creation of the dataset?	This work was carried out with support from Lacuna Fund, an initiative cofounded by The Rockefeller Foundation, Google.org, and Canada’s International Development Research Centre. The views expressed herein do not necessarily represent those of Lacuna Fund, its Steering Committee, its funders, or Meridian Institute.: 0328-S-001.
Composition	
What do the instances that comprise the dataset represent?	Each instance in the dataset consists of a crop image with an image status, i.e., Healthy, Maize Leaf Blight, and Maize Streak Virus, crop variety, crop age, and location (district, sub-county).
How many instances are there in total (of each type, if appropriate)?	The dataset contains 5326 healthy maize images, 5216 Maize Streak virus images, and 5279 Maize Leaf Blight maize images. The total number of maize image instances in the dataset is 15,821.
Does the dataset contain all possible instances or is it a sample (not necessarily random) of instances from a larger set?	The dataset contains maize image data collected across the different regions in Uganda. The dataset has image samples collected from significant maize growing districts selected with the guidance of agricultural experts to obtain a representative dataset.
What data does each instance consist of? “Raw” data or features?	The data consists of raw image data. Each image data point is accompanied with attributes; the crop variety, plant age, district, sub-county, the GPS location, GPS accuracy, and the date of image capture.
Is there a label or target associated with each instance? If so, please provide a description.	Each instance is associated with a class label based on the status of the crop: healthy or diseased. The given labels per image are: Healthy, Maize Streak Virus and Maize Leaf Blight as shown in Figure 1.
Is any information missing from individual instances?	None
Are relationships between individual instances made explicit?	There are no relationships between the different image instances in the dataset.
Are there recommended data splits (for example, training, development/validation, testing)?	We do not specify any data splits.
Are there any errors, sources of noise, or redundancies in the dataset? If so, please provide a description.	None
Is the dataset self-contained, or does it link to or otherwise rely on external resources?	The dataset is self-contained.

Does the dataset contain data that might be considered confidential?	No.
Does the dataset contain data that, if viewed directly, might be offensive, insulting, threatening, or might otherwise cause anxiety?	No.
Collection Process	
How was the data associated with each instance acquired?	The maize image data was collected using mobile phones from farmer gardens. The gardens were identified within the maize growing prominent districts across the four regions in Uganda.
What mechanisms or procedures were used to collect the data?	The data was collected using the Adsurv application, which is a mobile application that enables crowdsourcing of crop disease data from farmers' gardens. Adsurv application was installed on mobile phones/tablets used during the data collection process.
If the dataset is a sample from a larger set, what was the sampling strategy?	The dataset is not from a larger set.
Who was involved in the data collection process?	A team of researchers from the Makerere Artificial Intelligence Lab, an agricultural expert from the cereals program at National Crops Resources Research Institute (NaCRRI), and a district agricultural officer. The agricultural officer enabled us to bridge the language gap between the data collectors and the on-ground farmers in the different regions of the country.
Over what timeframe was the data collected?	May 2021
Were any ethical review processes conducted (for example, by an institutional review board)?	No.
Preprocessing, cleaning, and labelling	

Was any preprocessing/cleaning/labeling of the data done (for example, discretization or bucketing, tokenization, part-of-speech tagging, SIFT feature extraction, removal of instances, processing of missing values)?	We carried out data cleaning to remove blurry images, images taken under direct sunlight, and resolution of inconsistencies. For part of the collected data, the data collectors had to input image attribute variables, such as crop variety, manually. Some of the predetermined attributes like districts and sub-counties were modified during data collection. As a result, the generated dataset had inconsistencies like variations in reporting and district/sub-county corrections in cases where the data had been collected from a different location. These inconsistencies were resolved during the data cleaning process. The data was labeled using a custom web tool built on top of the VIA annotation tool (Abhishek 2021).
Was the “raw” data saved in addition to the preprocessed/cleaned/ labeled data (for example, to support unanticipated future uses)? If so, please provide a link or other access point to the “raw” data.	The raw unprocessed is stored locally on data storage servers in the Makerere Artificial Intelligence Lab.
Is the software that was used to preprocess/clean/label the data available? If so, please provide a link or other access point.	The link to the annotation tool is available: https://github.com/AI-Lab-Makerere/web-annotation-tool
Uses	
Has the dataset been used for any tasks already? If so, please provide a description.	Yes, we have used the dataset to build baseline disease classification models.
Is there a repository that links to any or all papers or systems that use the dataset?	No.
What (other) tasks could the dataset be used for?	The dataset can be used for building object detection, segmentation, and time-series analysis models.
Is there anything about the composition of the dataset or the way it was collected and preprocessed/cleaned/labeled that might impact future uses?	No.
Distribution	

Will the dataset be distributed to third parties outside of the entity (for example, company, institution, organization) on behalf of which the dataset was created? If so, please provide a description.	Yes, the dataset will be made publicly available.
How will the dataset be distributed (for example, tarball on website, API, GitHub)? Does the dataset have a digital object identifier (DOI)?	The dataset and the associated metadata are stored on the Harvard DataVerse which is an open-source data repository. The dataset is assigned a Digital Object Identifier: https://doi.org/10.7910/DVN/LPGHKK .
When will the dataset be distributed?	The dataset is available under the specified DOI.
Will the dataset be distributed under a copyright or other intellectual property (IP) license, and/or under applicable terms of use (ToU)?	The dataset is licensed under the CC BY license that allows users to share and adapt the dataset so long as they give credit to data set creators.
Have any third parties imposed IP-based or other restrictions on the data associated with the instances?	No.
Do any export controls or other regulatory restrictions apply to the dataset or to individual instances?	No.
Maintenance	
Who will be supporting/hosting/maintaining the dataset?	The dataset will be maintained by the research team at the Makerere Artificial Intelligence Lab. The team will support, host, and maintain the dataset.
How can the owner/curator/manager of the dataset be contacted (for example, email address)?	The dataset manager can be contacted via email.
Is there an erratum?	No.
Will the dataset be updated (for example, to correct labeling errors, add new instances, delete instances)?	All updates to the dataset will be documented and communicated through the Makerere AI Lab GitHub repository.
Will older versions of the data-set continue to be supported/hosted/ maintained? If so, please describe how.	Yes, the older versions will be stored locally on data storage servers in the Makerere Artificial Intelligence Lab and on remote data storage buckets on the Google cloud.

If others want to extend/augment/build on/contribute to the dataset, is there a mechanism for them to do so?	Interested researchers can send an email to data managers manager one and manager two to discuss the dataset extension and contribution.
